**Application:**

HOMA-air contactors serve the purpose of switching on and off DC and AC equipment of any kind (inductive and non-inductive loads).

**Construction:**

The fixed main switch contacts and the magnetic core with magnetic coils assembly are mounted on a horizontal bar. The moving contacts are fixed to the moveable shaft and the operating armature. Dependent on the type of contactor, from one to eight poles can be designed. The auxiliary contacts are mounted under the magnet operating system. The main switch contacts contains single-type interrupters and it find be easy to check or change during folding up the arc chambers. Each of any magnetic blow out coils are build on main switch contact and, therefore, the arc chambers shortens the burning life of the arc. Contactors for slip ring motor starting according list 280E, possess no blow out coils and arc chambers.

**Actuating:**

All contactors can be actuated with DC current via an economy contact and economy resistor. A rectifier is connected to the AC mains (see circuit 2 and 3 on page 10a). Contactors with AC magnets as per circuit 1.

**Magnetic coils:**

Corresponding to VDE 0660, HOMA contactors operate between 0,85 times up to 1,1 times the rated operating voltage. In case of non standard mounting conditions, consult with suppliers.

**Insulation:**

Creepage and air paths corresponding to the VDE 0110 group C. The voltage test is carried out in accordance with VDE 0660.

**Main switch contacts:**

The contactors possesses switching contacts with a C15s plating, which are suitable for permanent switching-on and for frequent switching. Exception G 320 and G 320v group A and C. This contactors have switches with a AgCdO plating.

**Arc chambers**

Dependent on the operating voltage and the switching duty, we deliver contactors as per following groups:

group A	with fibre cement chambers nominal insulating voltage $Ui = 750V$
group C	with steatite chambers and DY-blow out system nominal insulating voltage $Ui = 750V$ (G125 - G320v) nominal insulating voltage $Ui = 1000V$ (ab G 500)
group D	G 200 with fibre cement chambers 2 poles in series connection $Ui = 1000V$ ab G 320 with steatite chambers and DY-blow out system 2 pole in series connection $Ui = 1500V$
group 1000V	steatite chambers with DY-blow out system and Chamber mount $Ui = 1500V$ and $Ui = 3000V$

### **Switching capacity:**

The rated switching capacity is in accordance with the "Regulations for L.V. Switch Gear" VDE 0660.

### **Mechanical interlocking:**

Besides the electrical interlocking via auxiliary contacts, the contactors could be equipped with a mechanical interlocking against extra costs. For that purpose, the contactors must be arranged vertically on top of each other.

### **Mechanical coupling:**

According to group D, two contacts must be connected in series in case of higher operating voltages. For higher current, the poles of two or three contactors may be connected in series for that purpose. Besides electrical coupling through series connection of the coils, there is a mechanical coupling (see fig. 24) for the synchronous operating of the contactors.

### **higher operating frequencies:**

For their application in control installations and in static frequency transformers, the HOMA-contactor must be provided with a wound blow out coil and laminated blow out sheet.

### **Negative-contactors**

For the purpose of breaking and short-circuiting motors and generators, contactors can be supplied with NC contacts. See list 549 "Contactors with NC-contacts for on-load switching" and list 624 "Contactors with NC-contacts off-load switching".

### **operation aboard ships**

For operation aboard ships, the contactor are provided with a balance weight in order to balance a sloping position of 30° towards the normal mounting position (The contactor must be designed to suit the various climatic conditions). Examples are shown in fig. 28 - 28c.

### **climatic conditions**

The standard type of air contactors are suitable for tropics with 50% relative air humidity at 40°C, or up to 90% relative air humidity at 20°C, or up to 5% relative air humidity at 50°C. If the contactors are operated at a place that is situated between 15° northern latitude and 30° southern latitude, or on highly humidity areas (up to 95% relative air humidity and 45°C), they must be designed to suit the various climatic conditions (DIN 50010).

### Altitudes above sealevel

The quoted continuous currents and the continuous switching capacities are valid for mounting at altitudes up to 1000 m above sealevel. The derated values are:

91%	up to	2000 m above sealevel
87%	up to	3000 m above sealevel
and	82%	up to 4000 m above sealevel

### Rise of ambient temperature

With an ambient temperature of more than 35°C, the admissible continuous currents and switch capacities are derated to:

- 95% at 40°C
- 90% at 45°C
- 85% at 50°C
- 80% at 55°C

### Foreign standards

HOMA air contactors correspond to following standards:<sup>1)</sup>

I.E.C <sup>1)</sup>	-	International Electrotechnical Commission
NEMA	-	USA
CSA	-	Canada
BS	-	Great Britain
UTE	-	France
NBN	-	Belgium
AEI	-	Italy
LroS <sup>1)</sup>	-	Lloyd's Register of Shipping
DNV <sup>1)</sup>	-	Det Norske Veritas, Oslo

1) consult with suppliers

### Fixing:

The contactors must be mounted horizontally to two vertical steel fixings which shall not be longer than approximately one metre. Contactors with a bar up to 541 mm long may be fitted to a steel angle 50 x 50 x 5 mm, and still larger contactors to U-shape steel 65 or 80. HG-contactors are delivered fitted to a frame which also serves for transporting. For mounting of these contactors, it is recommended to provide a mounting angle each at the left side and at the right side within the contactor's rack; these angle serve as brackets for the contactor frames to be fixed to.

## Data required for orders

- 1) Quantity, type of contactor, number of poles and contactor group
  - 2) Type of switching, operating current, operating voltage and operating frequency
  - 3) switching duty
  - 4) control voltage for the magnetic coil and, possibly of the release magnet
  - 5) special designs and supplementary parts
- All data are subject to alternatives.

## Auxiliary contacts - Standard design 2NC + 4NO

The auxiliary contacts are normally open (NO) and normally closed (NC) contacts. The auxiliary contacts are mounted as auxiliary contact blocks under the magnet system (see page 10).

## Mechanical-durability

The mechanical-durability corresponds nearly to apparatus classes D1 - E1, where the life expectancy is inversely proportional to the size of the contactor. Dependent on the number of poles, the group of contactor, and the design of the supplementary parts, the mechanical-durability could be distinguish slightly.

## Parallel connection

In order to increase the rated current, two poles can be parallel connected; this should however be done only at the least one metre before and behind the contactor, because this length of line will have the effect of a stabilizing resistor.

## switching conditions

For the assessment of switching conditions, the following categories of use are set up in accordance with VDE 0660.

### **1) Alternating current**

#### **Category AC 1 (ohmic load)**

Easy switching conditions with ohmic or low inductive load ( $\cos. \varphi = 0,95$ )

Inrush current	=	rated operating current $I_e$
Breaking current	=	rated operating current $I_e$ (without counter current breaking)
rated operating current $I_e$	=	continuous current $I_{t,12}$

#### **Category AC 2 (slip ring rotors)**

Easy switching conditions ( $\cos. \varphi = 0,65$ )

Inrush current	=	$2,5 \times$ rated operating current $I_e$
Breaking current	=	rated operating current $I_e$ (without counter current breaking)
rated operating current $I_e$	=	$2,5 \times$ rated operating current $I_e$ (with counter current breaking)

#### **Category AC 3 (squirrel-cage motors)**

Normal switching conditions ( $\cos. \varphi = 0,35$ )

Inrush current	=	$6 \times$ rated operating current $I_e$
Breaking current	=	rated operating current $I_e$

#### **Category AC 4 (squirrel-cage motors)**

Difficult switching conditions, quick-operation, counter current breaking and reversing ( $\cos. \varphi = 0,35$ )

Inrush current	=	$6 \times$ rated operating current $I_e$
Breaking current	=	$6 \times$ rated operating current $I_e$

## **Switching of capacitors (capacitive load)**

When connecting capacitors in parallel to an already live capacitor bank, very high inrush current peaks occur. Capacitor contactor are described in List 507 and 616.

## Switching of induction furnaces with damping resistor

Normal switching conditions ( $\cos. \varphi = 1$ );  $\cos. \varphi$  of the furnace coil  $\geq 0,2$

Inrush current	=	8 x Rated operating current $I_e$
Breaking current	=	1,2 x Rated operating current $I_e$

*Note: with occasional inductive or capacitive detuning of the resonant circuit  $\cos. \varphi = 0,5$*

## Switching of induction channel furnaces or billet heater furnace without damping resistor

Moderately difficult switching conditions ( $\cos. \varphi = 0,75$  inductively up to  $\cos. \varphi = 1$ )

$\cos. \varphi$  of the furnace coil  $\geq 0,35$

Inrush current	=	12 x Rated operating current $I_e$
Breaking current	=	1,2 x Rated operating current $I_e$

## 2) Direct current

### Category DC 1 (ohmic load)

Easy switching conditions with ohmic or low inductive load ( $T = 1\text{ms}$ )

Inrush current	=	Rated operating current $I_e$
Breaking current	=	Rated operating current $I_e$
Rated operating current $I_e$	=	continuous current $I_{t_{12}}$

### Category DC 2 and DC 3 (shunt motors)

Normal switching conditions

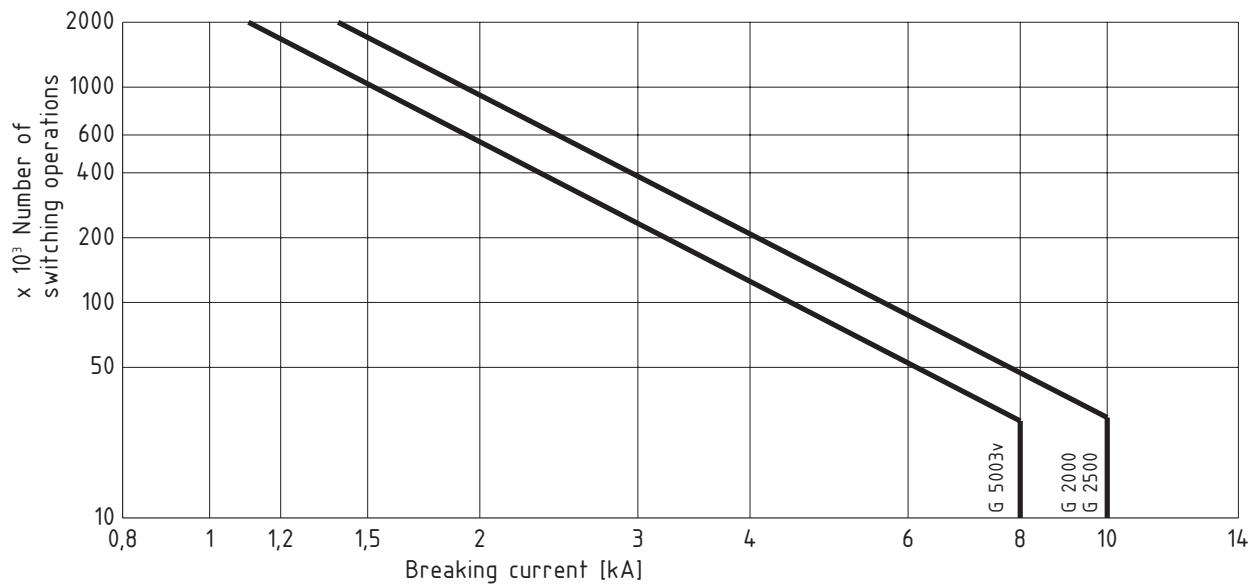

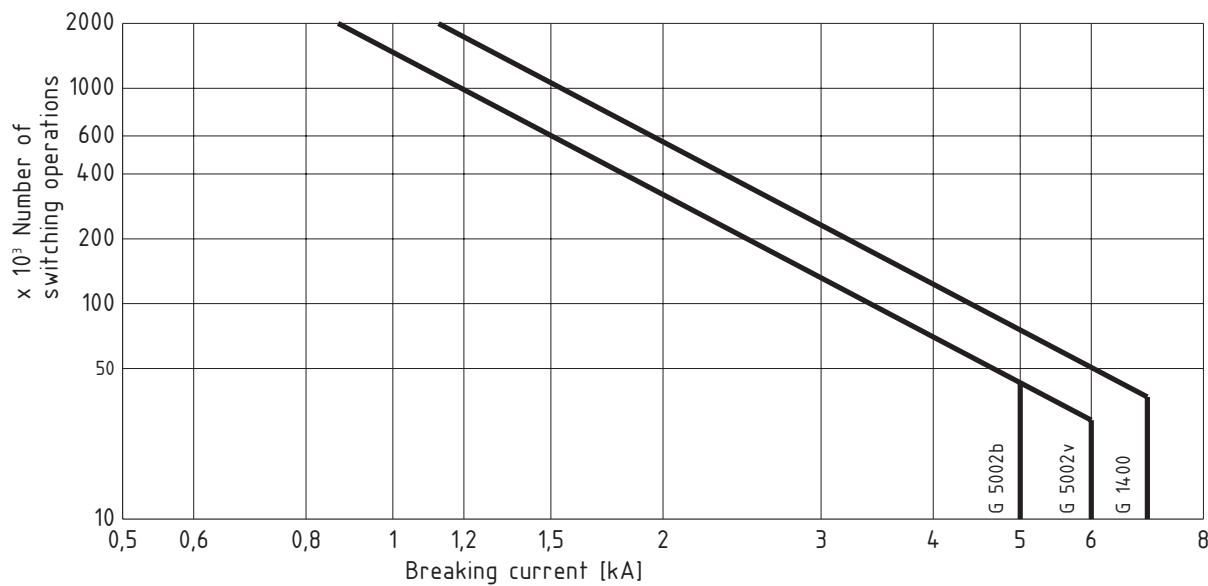

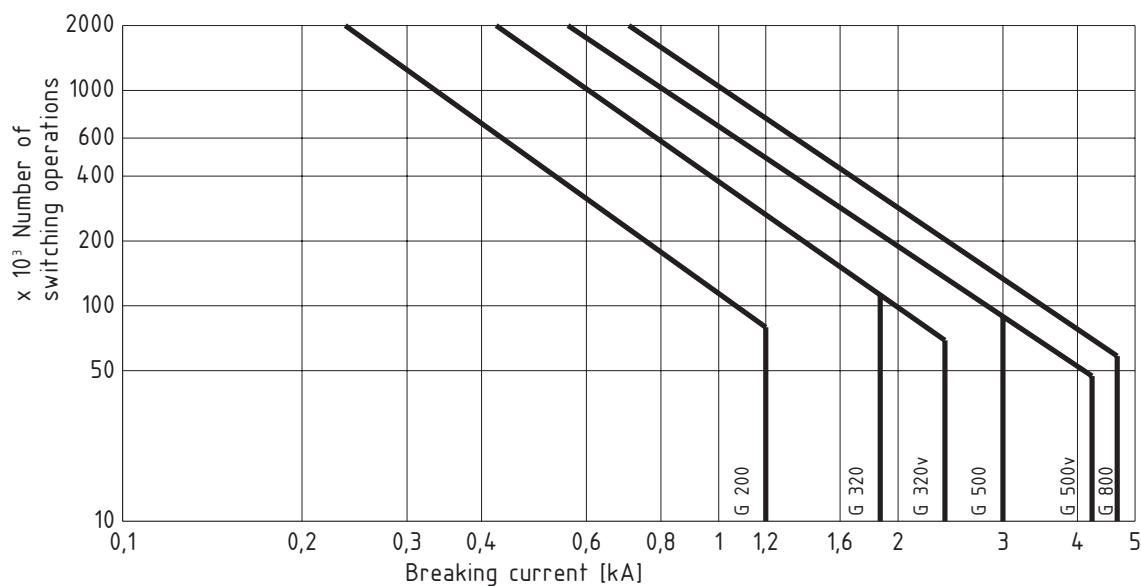

Inrush current	=	2,5 x Rated operating current $I_e$ bei $T = 2\text{ms}$
Breaking current	=	Rated operating current $I_e$ bei $T = 7,5\text{ms}$
or		2,5 x Rated operating current $I_e$ bei $T = 2\text{ms}$
or occasionally		4 x Rated operating current $I_e$ bei $T = 2,5\text{ms}$

### Category DC 4 (series motors)

Difficult switching conditions

Inrush current	=	2,5 x Rated operating current $I_e$ bei $T = 7,5\text{ms}$
Breaking current	=	Rated operating current $I_e$ bei $T = 10\text{ms}$
or		2,5 x Rated operating current $I_e$ bei $T = 7,5\text{ms}$
or occasionally		4 x Rated operating current $I_e$ bei $T = 15\text{ms}$

### Life expectancy as a function of the breaking current

- 1) D = damping contactors switch-in time  $t_e \leq 1,5s$
- 2) H = main or bridging contactor
- 3) required contactor connections as per list 411E
- 4) in case of voltages increased by a maximum of 10% and inductive or capacitive increase, the loading currents  $I_e$  of the main contactors may not be higher than their admissible continuous currents  $I_{th2}$ . With higher ambient temperature and mounting at higher altitudes, reducing factors shall be taken into account.
- 5) for 2-pole contactors AC connected, only 0,58 of the quoted 3-phase current outputs is permissible.

## Manufacturing-program

- 026/1 pole-changing switches, change over switches, circuit breakers
- 145E NF and MF high-current switches (air-cooled)
- 280E NF and MF contactors for off-load switching
- 282 Damping resistors
- 350/1E DC- and NF-contactors for on-load switching**
  - 421 Prism-contacts (air- and water-cooled)
  - 427E NF and MF high-current switches (watercooled)
  - 460 insulator-supports and bus-bar-supports
  - 467 MF-contactors for on-load switching
  - 475/1 Prism-contacts (air-cooled)
  - 502 cable (air- and water-cooled)
  - 506 discharge- and dropping-resistors
  - 507E capacitor-contactor for on-load switching
  - 549 contactors with NC-contacts for on-load switching
  - 559 Prism-contacts for the electrode-position
  - 560E spare parts
  - 600 pole-changing switches, with motor-drive (water-cooled)
  - 615 NF and MF high-current circuit breaker for off-load switching (water-cooled)
  - 617 NF and MF high-current circuit breaker for off-load switching (air-cooled)
  - 624 contactors with NC-contacts off-load switching
  - 625 DC-contactors with brake-contacts
  - 641 Air-cooled-current-carrying leads
